May 27, 2022

1 Content Based Filtering

Estimated time needed: 25 minutes

1.1 Objectives

After completing this lab you will be able to:

• Create a recommendation system using Content Based filtering

Recommendation systems are a collection of algorithms used to recommend items to users based on information taken from the user. These systems have become ubiquitous, and can be commonly seen in online stores, movies databases and job finders. In this notebook, we will explore Content-based recommendation systems and implement a simple version of one using Python and the Pandas library.

1.1.1 Table of contents

```
     <a href="https://#ref1">Acquiring the Data</a>
     <a href="https://#ref2">Preprocessing</a>
     <a href="https://#ref3">Content-Based Filtering</a>
```

2 Acquiring the Data

To acquire and extract the data, simply run the following Bash scripts:

Dataset acquired from GroupLens. Let's download the dataset. To download the data, we will use !wget to download it from IBM Object Storage.

Did you know? When it comes to Machine Learning, you will likely be working with large datasets. As a business, where can you host your data? IBM is offering a unique opportunity for businesses, with 10 Tb of IBM Cloud Object Storage: Sign up now for free

```

3 Preprocessing

First, let's get all of the imports out of the way:

Now you're ready to start working with the data!

```
[2]: #Dataframe manipulation library
import pandas as pd
#Math functions, we'll only need the sqrt function so let's import only that
from math import sqrt
import numpy as np
import matplotlib.pyplot as plt
%matplotlib inline
```

Now let's read each file into their Dataframes:

```
[3]: #Storing the movie information into a pandas dataframe
movies_df = pd.read_csv('movies.csv')
#Storing the user information into a pandas dataframe
ratings_df = pd.read_csv('ratings.csv')
#Head is a function that gets the first N rows of a dataframe. N's default is 5.
movies_df.head()
```

```
[3]:
        movieId
                                                   title \
                                       Toy Story (1995)
               1
     1
               2
                                         Jumanji (1995)
     2
               3
                               Grumpier Old Men (1995)
     3
               4
                             Waiting to Exhale (1995)
               5 Father of the Bride Part II (1995)
                                                  genres
        Adventure | Animation | Children | Comedy | Fantasy
     0
     1
                           Adventure | Children | Fantasy
     2
                                         Comedy | Romance
     3
                                  Comedy | Drama | Romance
     4
                                                  Comedy
```

Let's also remove the year from the **title** column by using pandas' replace function and store in a new **year** column.

/home/jupyterlab/conda/envs/python/lib/python3.7/sitepackages/ipykernel_launcher.py:7: FutureWarning: The default value of regex will change from True to False in a future version. import sys

```
[4]:
                                          title \
        movieId
                                      Toy Story
     0
               1
               2
                                        Jumanji
     1
     2
               3
                              Grumpier Old Men
               4
     3
                             Waiting to Exhale
               5 Father of the Bride Part II
                                                         year
                                                 genres
        Adventure | Animation | Children | Comedy | Fantasy
                                                         1995
     1
                           Adventure | Children | Fantasy
                                                         1995
     2
                                        Comedy | Romance 1995
     3
                                 Comedy | Drama | Romance 1995
```

With that, let's also split the values in the **Genres** column into a **list of Genres** to simplify for future use. This can be achieved by applying Python's split string function on the correct column.

```
[5]:
        movieId
                                         title \
     0
              1
                                     Toy Story
     1
              2
                                       Jumanji
     2
              3
                             Grumpier Old Men
     3
              4
                            Waiting to Exhale
     4
                 Father of the Bride Part II
                                                      genres
                                                              year
        [Adventure, Animation, Children, Comedy, Fantasy]
                                                              1995
     0
     1
                            [Adventure, Children, Fantasy]
                                                              1995
     2
                                          [Comedy, Romance]
                                                              1995
     3
                                   [Comedy, Drama, Romance]
                                                              1995
     4
                                                    [Comedy]
                                                              1995
```

Since keeping genres in a list format isn't optimal for the content-based recommendation system technique, we will use the One Hot Encoding technique to convert the list of genres to a vector where each column corresponds to one possible value of the feature. This encoding is needed for feeding categorical data. In this case, we store every different genre in columns that contain either 1 or 0. 1 shows that a movie has that genre and 0 shows that it doesn't. Let's also store this dataframe in another variable since genres won't be important for our first recommendation system.

```
1
          2
                                    Jumanji
2
          3
                         Grumpier Old Men
          4
3
                        Waiting to Exhale
4
             Father of the Bride Part II
                                                    genres
                                                            year
                                                                   Adventure
   [Adventure, Animation, Children, Comedy, Fantasy]
                                                                          1.0

                    0.0
```

[5 rows x 24 columns]

Next, let's look at the ratings dataframe.

[7]: ratings_df.head()

[7]:	userId	${\tt movieId}$	rating	timestamp
0	1	169	2.5	1204927694
1	1	2471	3.0	1204927438
2	1	48516	5.0	1204927435
3	2	2571	3.5	1436165433
4	2	109487	4.0	1436165496

Every row in the ratings dataframe has a user id associated with at least one movie, a rating and a timestamp showing when they reviewed it. We won't be needing the timestamp column, so let's

drop it to save memory.

```
[8]: #Drop removes a specified row or column from a dataframe
ratings_df = ratings_df.drop('timestamp', 1)
ratings_df.head()
```

/home/jupyterlab/conda/envs/python/lib/python3.7/sitepackages/ipykernel_launcher.py:2: FutureWarning: In a future version of pandas all arguments of DataFrame.drop except for the argument 'labels' will be keyword-only

```
[8]:
        userId movieId
                           rating
     0
              1
                      169
                               2.5
     1
              1
                     2471
                               3.0
     2
                    48516
                               5.0
              1
     3
              2
                     2571
                               3.5
     4
              2
                   109487
                               4.0
```

4 Content-Based recommendation system

Now, let's take a look at how to implement **Content-Based** or **Item-Item recommendation systems**. This technique attempts to figure out what a user's favourite aspects of an item is, and then recommends items that present those aspects. In our case, we're going to try to figure out the input's favorite genres from the movies and ratings given.

Let's begin by creating an input user to recommend movies to:

Notice: To add more movies, simply increase the amount of elements in the **userInput**. Feel free to add more in! Just be sure to write it in with capital letters and if a movie starts with a "The", like "The Matrix" then write it in like this: 'Matrix, The'.

```
[9]:
                        title
                                rating
        Breakfast Club, The
     0
                                   5.0
     1
                   Toy Story
                                   3.5
     2
                      Jumanji
                                   2.0
     3
                Pulp Fiction
                                   5.0
     4
                        Akira
                                   4.5
```

Add movieId to input user With the input complete, let's extract the input movie's ID's from the movies dataframe and add them into it.

We can achieve this by first filtering out the rows that contain the input movie's title and then merging this subset with the input dataframe. We also drop unnecessary columns for the input to save memory space.

```
[10]: #Filtering out the movies by title
inputId = movies_df[movies_df['title'].isin(inputMovies['title'].tolist())]
#Then merging it so we can get the movieId. It's implicitly merging it by title.
inputMovies = pd.merge(inputId, inputMovies)
#Dropping information we won't use from the input dataframe
inputMovies = inputMovies.drop('genres', 1).drop('year', 1)
#Final input dataframe
#If a movie you added in above isn't here, then it might not be in the original
#dataframe or it might spelled differently, please check capitalisation.
inputMovies
```

/home/jupyterlab/conda/envs/python/lib/python3.7/sitepackages/ipykernel_launcher.py:6: FutureWarning: In a future version of pandas all arguments of DataFrame.drop except for the argument 'labels' will be keyword-only

```
[10]:
         movieId
                                 title rating
                             Toy Story
                                            3.5
      0
               1
               2
                                            2.0
      1
                               Jumanji
                          Pulp Fiction
      2
                                            5.0
             296
      3
            1274
                                  Akira
                                            4.5
            1968 Breakfast Club, The
                                            5.0
```

We're going to start by learning the input's preferences, so let's get the subset of movies that the input has watched from the Dataframe containing genres defined with binary values.

```
[11]:
            movieId
                                    title \
                                Toy Story
                   1
                  2
                                   Jumanji
      1
      293
                296
                             Pulp Fiction
      1246
               1274
                                     Akira
      1885
               1968 Breakfast Club, The
```

```
genres year Adventure \
0 [Adventure, Animation, Children, Comedy, Fantasy] 1995 1.0
```

1 293 1246 1885		[A		Advent omedy, Advent	Crime	e, Dram Animat	a, Th	nrill Sci-	er] Fi]			1.0 0.0 1.0 0.0	
	Animatio	on Ch	ildren	Comed	y Fa	antasy	Roma	ance		Horror	Mys	tery	\
0	1	.0	1.0	1.	•	1.0		0.0		0.0	,	0.0	
1	0	.0	1.0	0.	0	1.0		0.0		0.0		0.0	
293	0	.0	0.0	1.	0	0.0		0.0		0.0		0.0	
1246	1	.0	0.0	0.	0	0.0		0.0		0.0		0.0	
1885	0	.0	0.0	1.	0	0.0		0.0		0.0		0.0	
0 1 293 1246 1885	Sci-Fi 0.0 0.0 0.0 1.0 0.0	IMAX 0.0 0.0 0.0 0.0	Docume	0.0 0.0 0.0 0.0 0.0	War 0.0 0.0 0.0 0.0	0	al V	0	rn .0 .0 .0	0 0	ir .0 .0 .0	\	
	(no gen	res li	sted)										
0			0.0										
1			0.0										
293			0.0										
1246			0.0										
1885			0.0										

[5 rows x 24 columns]

We'll only need the actual genre table, so let's clean this up a bit by resetting the index and dropping the movieId, title, genres and year columns.

/home/jupyterlab/conda/envs/python/lib/python3.7/sitepackages/ipykernel_launcher.py:4: FutureWarning: In a future version of pandas all arguments of DataFrame.drop except for the argument 'labels' will be keyword-only

after removing the cwd from sys.path.

[12]:	Adventure	Animation	Children	Comedy	Fantasy	Romance	Drama	Action	\
0	1.0	1.0	1.0	1.0	1.0	0.0	0.0	0.0	
1	1.0	0.0	1.0	0.0	1.0	0.0	0.0	0.0	

2	0	.0	0.0	0.0	1.0	0.0	0.0	1.0	0.0	
3	1	.0	1.0	0.0	0.0	0.0	0.0	0.0	1.0	
4	0	.0	0.0	0.0	1.0	0.0	0.0	1.0	0.0	
	Crime 5	Thriller	Horror	Mystery	Sci-Fi	IMAX	Documentary	War	Musical	\
0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	
1	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	
2	1.0	1.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	
3	0.0	0.0	0.0	0.0	1.0	0.0	0.0	0.0	0.0	
4	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	
	Western	Film-No	ir (no	genres li	sted)					
0	0.0	0	.0		0.0					
1	0.0	0	.0		0.0					
2	0.0	0	.0		0.0					
3	0.0	0	.0		0.0					
4	0.0	0	.0		0.0					

Now we're ready to start learning the input's preferences!

5.0

Crime

To do this, we're going to turn each genre into weights. We can do this by using the input's reviews and multiplying them into the input's genre table and then summing up the resulting table by column. This operation is actually a dot product between a matrix and a vector, so we can simply accomplish by calling the Pandas "dot" function.

```
[13]: inputMovies['rating']
[13]: 0
           3.5
           2.0
      1
      2
           5.0
      3
           4.5
      4
           5.0
      Name: rating, dtype: float64
[14]: #Dot produt to get weights
      userProfile = userGenreTable.transpose().dot(inputMovies['rating'])
      #The user profile
      userProfile
[14]: Adventure
                             10.0
      Animation
                              8.0
      Children
                              5.5
      Comedy
                             13.5
      Fantasy
                              5.5
      Romance
                              0.0
      Drama
                             10.0
      Action
                              4.5
```

5.0
0.0
0.0
4.5
0.0
0.0
0.0
0.0
0.0
0.0
0.0

Now, we have the weights for every of the user's preferences. This is known as the User Profile. Using this, we can recommend movies that satisfy the user's preferences.

Let's start by extracting the genre table from the original dataframe:

/home/jupyterlab/conda/envs/python/lib/python3.7/site-packages/ipykernel_launcher.py:4: FutureWarning: In a future version of pandas all arguments of DataFrame.drop except for the argument 'labels' will be keyword-only

after removing the cwd from sys.path.

4.0.1 Advantages and Disadvantages of Content-Based Filtering

Advantages

- Learns user's preferences
- Highly personalized for the user

Disadvantages

- Doesn't take into account what others think of the item, so low quality item recommendations might happen
- Extracting data is not always intuitive
- Determining what characteristics of the item the user dislikes or likes is not always obvious

Want to learn more?

IBM SPSS Modeler is a comprehensive analytics platform that has many machine learning algorithms. It has been designed to bring predictive intelligence to decisions made by individuals, by groups, by systems – by your enterprise as a whole. A free trial is available through this course, available here: SPSS Modeler

Also, you can use Watson Studio to run these notebooks faster with bigger datasets. Watson Studio is IBM's leading cloud solution for data scientists, built by data scientists. With Jupyter notebooks, RStudio, Apache Spark and popular libraries pre-packaged in the cloud, Watson Studio enables data scientists to collaborate on their projects without having to install anything. Join the fast-growing community of Watson Studio users today with a free account at Watson Studio

4.0.2 Thank you for completing this lab!

4.1 Author

Saeed Aghabozorgi

4.1.1 Other Contributors

Joseph Santarcangelo

4.2 Change Log

Date (YYYY-MM-DD)	Version	Changed By	Change Description
2020-11-03	2.1	Lakshmi	Updated URL of csv
2020-08-27	2.0	Lavanya	Moved lab to course repo in GitLab
